

VUMA: CONNECT LOCAL SYSTEM TO CLOUD

1. CREATE CLOUD DATABASES

In Neon create: vuma_registry, vuma_cloud, and one database per company.

2. CONFIGURE CLOUDAPI

```
export ConnectionStrings__Registry='postgresql://USER:PASSWORD@HOST/vuma_registry?sslmode=require'
export ConnectionStrings__Vuma='postgresql://USER:PASSWORD@HOST/vuma_cloud?sslmode=require'
export Vuma__Jwt__SigningKey='LONG_RANDOM_PRODUCTION_SECRET'
export Vuma__Sync__Node__NodeId='cloud'
```

Run:

```
dotnet VumaRetail.CloudApi.dll --migrate
```

3. CONFIGURE EACH LOCAL STORESERVER

```
export ConnectionStrings__Vuma='Host=localhost;Port=5432;Database=vuma;Username=vuma;Password=LOCAL_PASSWORD'
export Vuma__Sync__Node__NodeId='store:acme'
export Vuma__Sync__Peer__NodeId='cloud'
export Vuma__Sync__Peer__BaseAddress='https://api.yourdomain.com/'
export Vuma__Sync__Peer__AccessToken='STORE_SPECIFIC_SYNC_TOKEN'
export Vuma__Sync__Peer__Timeout='00:02:00'
export Vuma__Sync__Dispatcher__Enabled='true'
```

Each store must use its own sync token.

4. NETWORK RULES

Local StoreServer needs outbound HTTPS access to <https://api.yourdomain.com>.

Do not expose PostgreSQL publicly.

Do not put Neon credentials on PCs, tills, desktop clients, or mobile devices.

Only CloudApi connects to Neon.

5. TEST

```
curl https://api.yourdomain.com/health
```

Expected: {"status":"ok"}

Then create a test sale locally and confirm it reaches the cloud.

FLOW

PC / Mobile -> HTTPS -> StoreServer -> HTTPS sync -> CloudApi -> PostgreSQL -> Neon
